Laboratory**

The ID31 Micro Station

Introduction - The Nano Active Stabilization System (NASS)

Objective: Improve the position accuracy from $\approx 10 \mu m$ down to $\approx 10 nm$

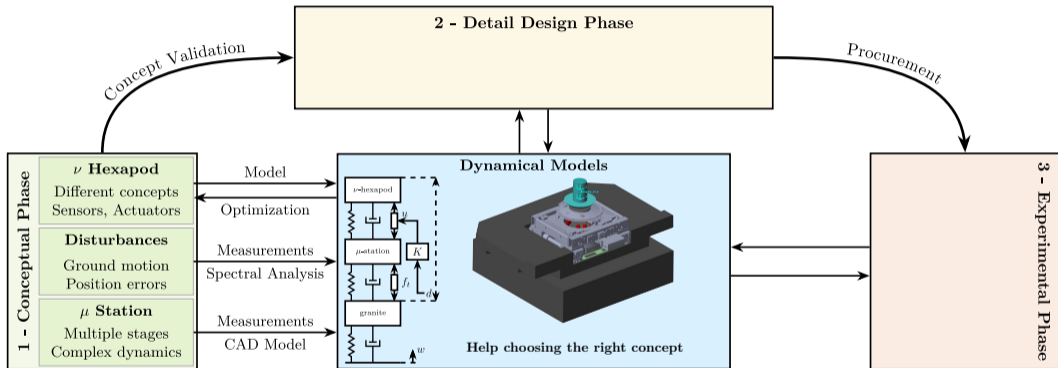

Design approach: "Model based design" / "Predictive Design"

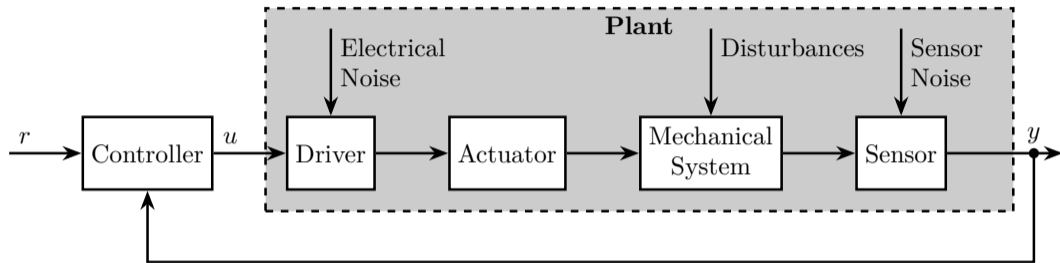

Overview of the Mechatronic Approach - Model Based Design

Outline - Conceptual Phase

Feedback Control - The Control Loop

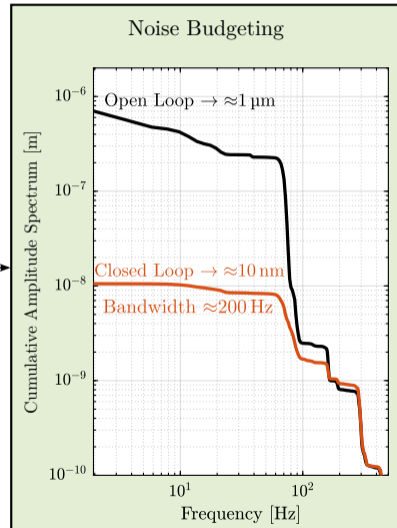

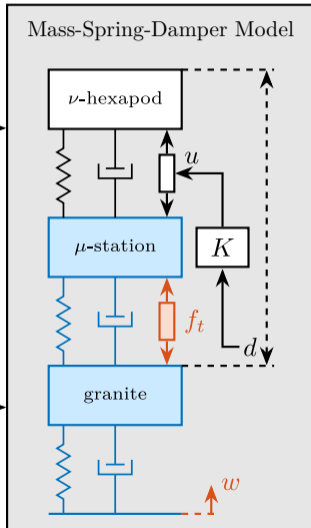

Why Feedback?

- Model uncertainties
- Unknown disturbances

Every elements can limit the performances

- Drivers, Actuators, Sensors
- Mechanical System
- Controller

Noise Budgeting and Required Control Bandwidth

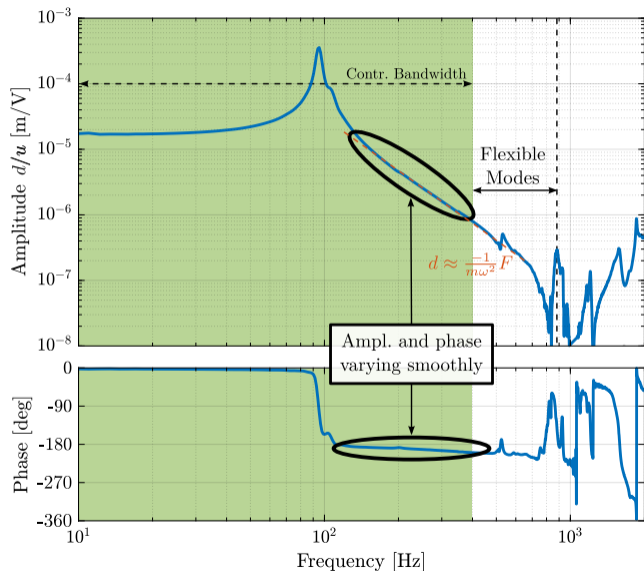

Limitation of the Controller Bandwidth?

Typical Approach

“As stiff as possible”
Simple controller (e.g. PID)

Limitation of the Controller Bandwidth?

Alternative Approach

Limited by complex dynamics
Model based controller

Soft or Stiff ν -hexapod ? Interaction with the μ -station

Soft or Stiff ν -hexapod ? Interaction with the μ -station

Complexity of the Micro-Station Dynamics (Model Analysis)

a) 11Hz

b) 18Hz

c) 37Hz

d) 40Hz

e) 54Hz

f) 56Hz

g) 70Hz

h) 72Hz

i) 72Hz

j) 85Hz

k) 90Hz

l) 91Hz

m) 96Hz

n) 105Hz

o) 107Hz

p) 113Hz

q) 117Hz

r) 124Hz

s) 145Hz

t) 150Hz

Control Strategy: HAC-LAC

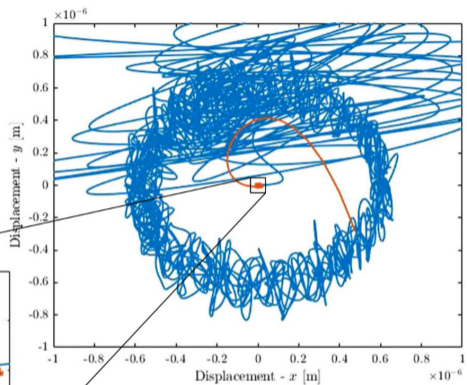

Low Authority Control

- Collocated sensors/actuators
- Guaranteed Stability, simple K
- Adds damping
- ↘ vibration near resonances

High Authority Control

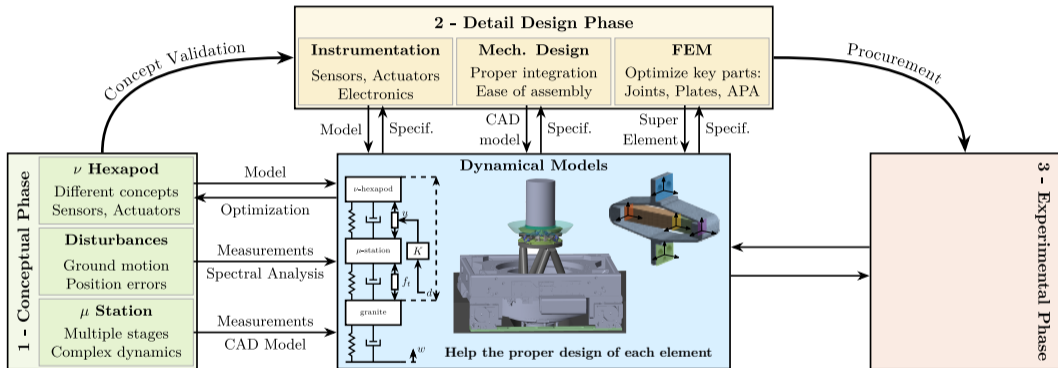

- Position sensors
- Complex dynamics
- Use transformation matrices
- ↘ vibration in the bandwidth

Multi-Body Models - Simulations

Validation of the concept

Outline - Detail Design Phase

Nano-Hexapod Overview - Key elements

General Specifications

- Flexible modes as high as possible
- Only flexible elements (no backlash, play, etc.)
- Integrated Force Sensor and Displacement Sensor
- Predictable dynamics

Choice of Actuator and Flexible Joint Design

Characteristic	Specs	Doc.
Axial Stiff.	$\approx 2 \text{ N}/\mu\text{m}$	$1.8 \text{ N}/\mu\text{m}$
Sufficient Stroke	$>100 \mu\text{m}$	$368 \mu\text{m}$
Height	$<50 \text{ mm}$	30 mm
High Resolution	$<5 \text{ nm}$	3 nm

Characteristic	Specs	FEM
Axial Stiff.	$>100 \text{ N}/\mu\text{m}$	94
Bending Stiff.	$<100 \text{ Nm}/\text{rad}$	5
Torsion Stiff.	$<500 \text{ Nm}/\text{rad}$	260
Bending Stroke	$>1 \text{ mrad}$	20

Fig.: Picture of the APA300ML

Fig.: Picture of the joint

Instrumentation

Fig.: PiezoDrive - PD200 Amplifier

Characteristics	Manual
Gain	20
Noise	0.7 mV rms
Small Signal BW	7.4 kHz
Large Signal BW	300 Hz

Fig.: Renishaw - Vionic Encoder

Characteristics	Manual
Range	Ruler length
Resolution	2.5 nm
Sub-Divisional Error	$< \pm 15$ nm
Bandwidth	> 5 kHz

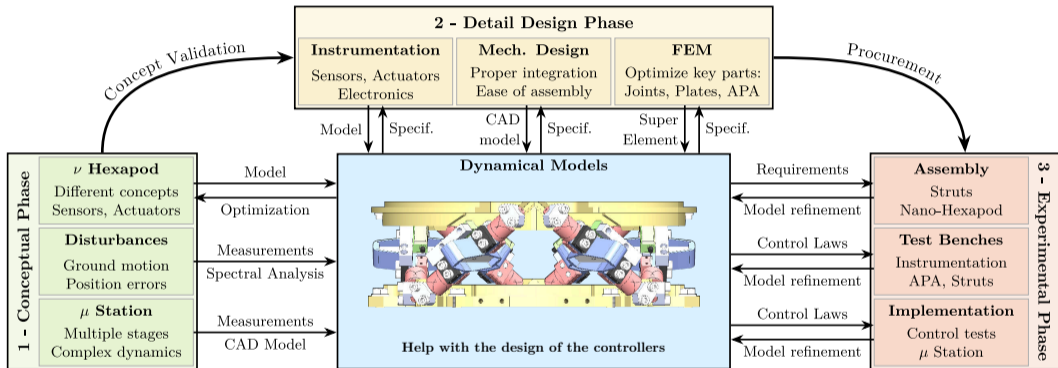

Fig.: Speedgoat - Target Machine

Characteristics	Manual
ADC (x16)	16bit, ± 10 V
DAC (x8)	16bit, ± 10 V
Digital I/O (x30)	$< \pm 15$ nm
Sampling Freq.	> 10 kHz

All elements could be chosen/design based on the models

Outline - Experimental Phase

Flexible Joints - Measurements

Other Measurement Benches

- Amplifier Output Noise and Bandwidth
- Encoder Measurement Noise
- DAC Output Noise

Amplified Piezoelectric Actuator - Test Bench

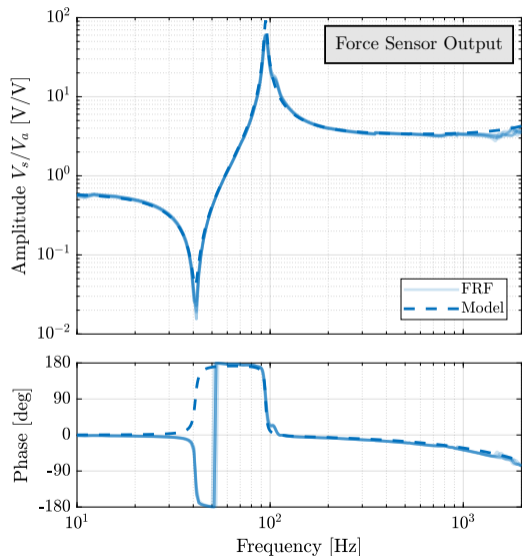

Goals

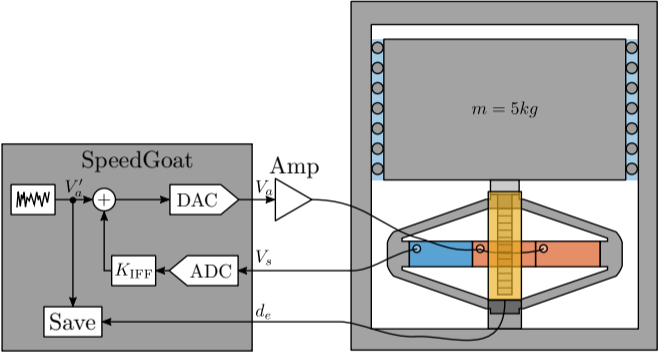

- Identify Dynamics
- Tune APA Model
- Test IFF

Amplified Piezoelectric Actuator - Measured FRF and Extracted Model

Amplified Piezoelectric Actuator - Integral Force Feedback

$$K_{IFF}(s) = \frac{g}{s}$$

Strut - Mounting Tool

Strut - Dynamical Measurements

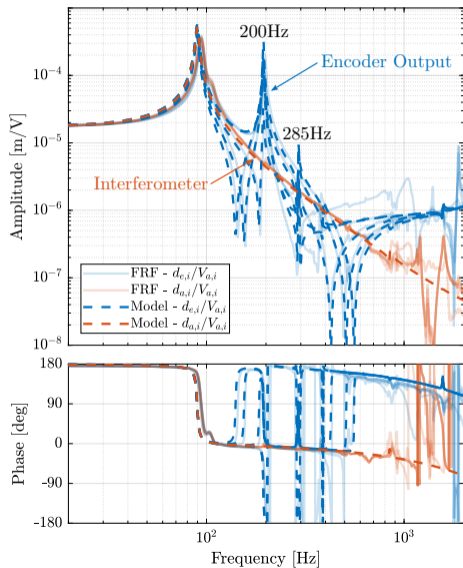

Goals

- Identify Dynamics
- Tune Model
- Flexible joints effects
- Encoder effect

Strut - Encoders Output and Spurious Modes

Nano-Hexapod Mounting Tool

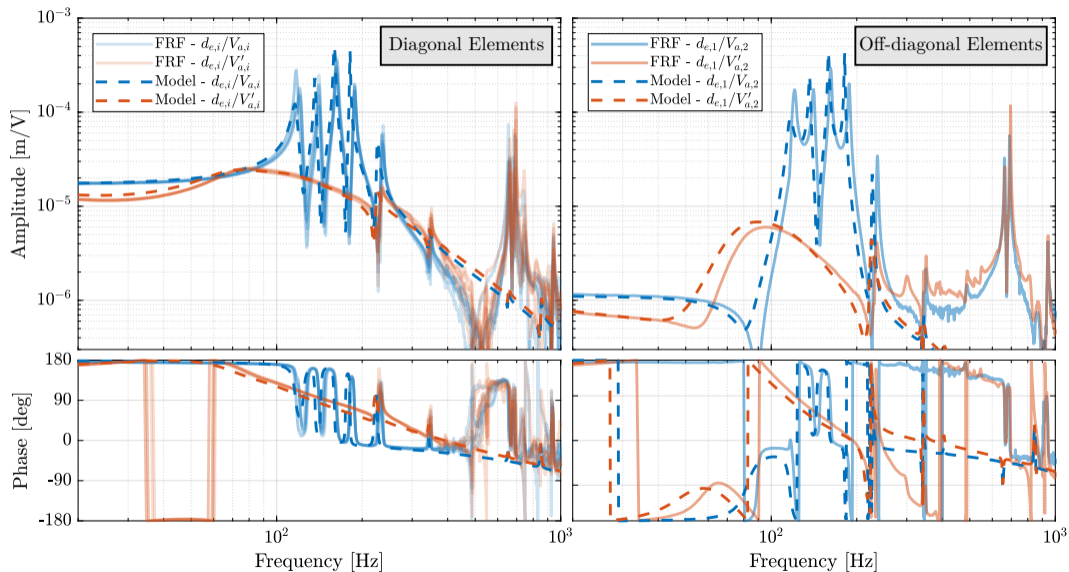

Mounted Nano-Hexapod

Nano-Hexapod - Identified Dynamics (Diagonal elements)

Nano-Hexapod - Damped Dynamics

The Nano-Hexapod on top of the Micro-Station

The Nano-Hexapod on top of the Micro-Station

Conclusion

Mechatronics Approach:

- Use of several models
- Predictive design
- Beneficial in terms of: cost, delays, performances

Future Work:

- Optimal/Robust control
- Control Test Bench
- Implementation on ID31
